ShockLink™ Defibrillation Training Tool

ShockLink™ is a compact solution for standardized defibrillation training that enables teams to easily integrate their equipment into a realistic and controlled training environment.

The ShockLink device connects to adhesive training pads on one end, and to the user's defibrillator on the other end. ShockLink works by creating a recognizable heart rhythm, then, in-turn, safely recognizes the shock delivered by the defibrillator. When a shockable rhythm is displayed, the training participant can deliver a normal shock, as one would give in a real clinical situation. The generated rhythm is affected by the shock and the actual energy is safely absorbed in the cable between the defibrillator and ShockLink device. ShockLink is compatible with virtually any manikin as well as most defibrillators.

ShockLink System

Includes:

- ShockLink Device
- User Guide
- Defibrillator Training Pads for ShockLink
- ShockLink Remote Control
- ShockLink Pouch

ShockLink™ Defibrillation Training Tool

Works with Most Manikins

ShockLink™ works with virtually any manikin because the heart rhythms generated by the ShockLink device are independent of the manikin used. Additionally, Laerdal's AED manikins are capable of detecting proper pad placement and can connect with the SimPad® SkillReporter™, providing real-time and summative feedback.

Simulates Eight Heart Rhythms

ShockLink can simulate eight heart rhythms: Sinus, VT Slow, VT Fast, SVT, VF, PEA, Asystole, and Brady. The user can select between different rhythms using the ShockLink App, ShockLink Remote Control or by using the SimPad® SkillReporter™ (Laerdal AED manikin required).

Compatible with Leading Brand Defibrillators

Team members can train with the equipment they regularly use. ShockLink plugs directly into compatible Philips AEDs/defibrillators. Adapters can be purchased for other compatible brands/models.

Advanced Feedback Capabilities

When SimPad SkillReporter (Laerdal AED manikin required) is used to run a ShockLink training session, learners and instructors can view real-time and summative feedback. Therefore, all actions relating to administering quality CPR, to placing the pads correctly, and delivering a shock with minimal interruptions can be assessed accurately and used for subsequent debriefing.

Services

Laerdal offers comprehensive Educational Services to support your program, and Technical Services to meet your equipment servicing needs.
