

Analytics: Compliance and Performance Data for Quality Improvement

Understand. Focus. Improve.

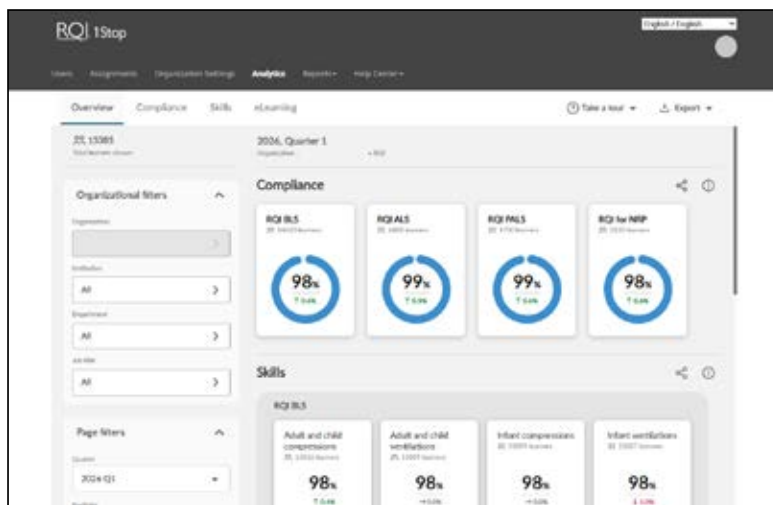

Analytics: Insights that drive better outcomes.

Analytics provides a unified view of organizational compliance, skills, and eLearning data in clear, easy-to-navigate dashboards. Administrators can view performance data to analyze trends across their organization, departments, or individual learners through various charts and graphs. These insights can help organizations discover meaningful performance trends and focus improvement efforts.

The Power of Performance Data and Trends

The integrated Analytics application allows administrators to view and analyze aggregate data at the organization, institution, department, job type, or learner levels. Focused on detailed performance of skills assessments and eLearning activities, Analytics displays data in a combination of ways including visual models, charts, lists, and through exporting raw data. The compliance section identifies a total learner count for those who have or have not completed their quarterly requirements and shows historical compliance trends and behavior. Analytics is intended to be used in association with reporting available on RQI IStop to visualize your organization's skill performance data.

- To make the data manageable, Analytics displays historical data that refreshes on the first day of each calendar quarter.*
- Analytics is available for the following programs: RQI® BLS, ALS, PALS Provider and HeartCode® Complete BLS, ACLS, PALS.
- Accessed through the RQI IStop administrator portal, Analytics users will see an overview page that summarizes the previous quarters' activity as well as historical performance.
- Current quarter compliance and completion data is available through RQI IStop or your 3rd party LMS reports.

*eLearning displays data beginning January 1, 2026, aligned with the redesigned curriculum and cognitive assessment activities for the 2025 AHA/AAP Guidelines.
